1 Mathematical Programming basics

```

model "Chess 1"
  uses "mmps" ! Use Xpress Optimizer for solving

  declarations
    xs, xl: mpvar ! Decision variables
  end-declarations

  Time:= 3*xs + 2*xl <= 160 ! Constraint: limit on working hours
  Wood:= xs + 3*xl <= 200 ! Constraint: raw mat. availability

  xs is_integer; xl is_integer ! Integrality constraints

  maximize(5*xs + 20*xl) ! Objective: maximize total profit

  writeln("Solution: ", getobjval) ! Print objective function value

  writeln("small: ", getsol(xs)) ! Print solution for xs
  writeln("large: ", getsol(xl)) ! and xl

  write("Time: ", getact(Time)) ! Constraint activity
  writeln(" ", getslack(Time)) ! and slack

end-model

```

1.1 Decision variables

```

declarations
  x, b, d: mpvar
  ifmake: array(1..10, 1..20) of mpvar
  y, z: array(1..10) of mpvar
end-declarations

```

`mpvar` means *mathematical programming variable* or *decision variable*, sometimes also just called *variable*. Decision variables are unknowns: they have no value until the model is run, and the optimizer finds values for the decision variables.

Variables can take values between 0 and infinity by default, other bounds may be specified:

```

x <= 10
y(1) = 25.5
y(2) is_free
z(2,3) >= -50
z(2,3) <= 50

```

Integer programming types are defined as unary constraints on previously declared decision variables

```

b is_binary ! Single binary variable
forall(p in PRODS, l in LINES)
  ifmake(p,l) is_binary ! An array of binaries
d is_integer ! An integer variable
d <= 25 ! Upper bound on the variable
x is_partint 10 ! Partial integer (integers up to 10, continuous beyond)
y(3) is_semcont 5 ! Semi-continuous (0 or greater or equal 5)

```

1.2 Constraints

Constraint are declared just like decision variables, in LP/MIP problems they have type `linctr` – linear constraint.

```
declarations
  MaxCap: linctr
  Inven: array(1..10) of linctr
end-declarations
```

The “value” of a constraint entity is a linear expression of decision variables, a constraint type (\leq , \geq , $=$), and a constant term. It is set using an assignment statement:

```
MaxCap := 10*x + 20*y + 30*z <= 100
Ctr(3) := 4*x(1) - 3*x(2) >= 10
Inven(2) := stock(2) = stock(1) + buy(2) - sell(2)
```

1.3 Objective function

An objective function is just a constraint with no constraint type.

```
declarations
  MinCost: linctr
end-declarations

MinCost := 10*x(1) + 20*x(2) + 30*x(3) + 40*x(4)
```

1.4 Optimization

```
minimize (MinCost)

maximize (MaxProfit)
```

1.5 Viewing the matrix

After defining the problem the matrix can be output to a file, to examine off line.

Specify LP format for constraint oriented file: `exportprob(EP_MIN, "explout", MinCost)`

Useful Optimizer control settings: `setparam('XPRS_VERBOSE', true)`
`setparam('XPRS_LOADNAMES', true)`

1.6 Viewing the solution

Always check the solution status of the problem before accessing any solution values.

```
if (getprobstat=XPRS_OPT) then
  writeln('optimal!')
else
  writeln('not optimal!')
  exit(1)
end-if
```

Alternatively, testing all problem states:

```
case getprobstat of
  XPRS_OPT: writeln('optimal')
```

```

XPRS_INF: writeln('infeasible')
XPRS_UNB: writeln('unbounded')
XPRS_UNF: writeln('unfinished')
else
  writeln('unexpected problem status!')
end-case

```

Accessing the solution values within the model:

```

writeln('Maximum revenue: $', getobjval)
writeln('x(1) = ', getsol(x(1)), ' x(2) = ', x(2).sol)

```

Solution values of constraints: activity value + slack value = RHS

```

MaxCap := 10*x + 20*y <= 30

Activity value:  getsol(10*x + 20*y)
                  getact(MaxCap)

Slack value:     getsol(30 - (10*x + 20*y))
                  getslack(MaxCap)

```

Xpress Workbench: assuming that the model runs successfully, the logging pane at the bottom of the workspace reports that the run is complete. If a model has been run through the debugger, you can browse solution values of decision variables and constraints in the *Debugger* tab on the right side of the workspace.

2 Data handling basics

```

model "Chess 3"
uses "mmaxprs"

declarations
  R = 1..2                                ! Index range
  DUR, WOOD, PROFIT: array(R) of real    ! Coefficients
  x: array(R) of mpvar                   ! Array of variables
end-declarations

DUR   :: [3, 2]                            ! Initialize data arrays
WOOD  :: [1, 3]
PROFIT:: [5, 20]

sum(i in R) DUR(i)*x(i) <= 160            ! Constraint definition
sum(i in R) WOOD(i)*x(i) <= 200
forall(i in R) x(i) is_integer

maximize(sum(i in R) PROFIT(i)*x(i))
writeln("Solution: ", getobjval)
end-model

```

2.1 Data types

Constant data

```

declarations
  N WEEKS = 20
  N DAYS = 7*N WEEKS
  CONV_RATE = 1.425
  DATA_DIR = 'c:\data'
end-declarations

```

Variable data

Declaration	<pre> declarations NPROD: integer SCOST: real MAXREFVEG: real DIR: string IF_DEBUG: boolean HARD: array(1..5) of real COST: array(1..3,1..4) of real end-declarations </pre>
Initialization	<pre> NPROD := 20 SCOST := 5 MAXREFVEG := 200.0 DIR := 'c:\data' IF_DEBUG := true HARD :: [8.8, 6.1, 2.0, 4.2, 5.0] COST :: [11, 12, 13, 14, 21, 22, 23, 24, 31, 32, 33, 34] </pre>

2.2 Sums and loops

Summations

Sum up an array of variables in a constraint:

```

MaxCap := sum(p in 1..10) buy(p) <= 100

MaxCap := sum(p in 1..10) (buy(p) + sum(r in 1..5) make(p,r)) <= 100

MaxCap := sum(p in 1..NP, t in 1..NT)
          CAP(p)*buy(p,t) <= MAXCAP

MaxCap := sum(p in 1..NP) (2*CAP(p)*buy(p)/10 +
                          SCAP(p)*sell(p)) <= MAXCAP

```

Loops

Use a loop to assign an array of constraints:

```

forall(t in 2..NT)
  Inven(t) := bal(t) = bal(t-1) + buy(t) - sell(t)

```

Use do/end-do to group several statements into one loop

```

forall(t in 1..NT) do
  MaxRef(t) := sum(i in 1..NI) use(i,t) <= MAXREF(t)

  Inven(t) := store(t) = store(t-1) + buy(t) - use(t)
end-do

```

Can nest forall statements:

```

forall(t in 1..NT) do
  MaxRef(t) := sum(i in 1..NI) use(i,t) <= MAXREF(t)

  forall(i in 1..NI)
    Inven(i,t) := store(i,t) = store(i,t-1) + buy(i,t) - use(i,t)
  end-do
end-do

```

Similarly for specification of bounds (a bound is just a simple unnamed constraint):

```

forall(i in 1..NI) do
  forall(t in 1..NT) store(i,t) <= MAXSTORE(t)
  store(i,0) = STORE0
end-do

```

May include **conditions** in sums or loops:

```
forall(c in 1..10 | CAP(c) >= 100.0)
  MaxCap(c) :=
    sum(i in 1..10, j in 1..10 | i <> j)
      TECH(i, j, c) * x(i, j, c) <= MAXTECH(c)
```

2.3 Index sets

Explicit statement:

```
declarations
  MaxCap: array(1..10) of linctr
end-declarations

forall(d in 1..10)
  MaxCap(d) :=
    sum(p in 1..10, m in 1..10)
      TECH(p, m, d) * x(p, m, d) <= MAXTECH(d)
```

Defining named sets:

```
declarations
  PRODUCTS = 1..5
  MATERIALS = {12, 487, 163}
  DEPOTS = {"Boston", "New York", "Atlanta"}

  MaxCap: array(DEPOTS) of linctr
end-declarations

forall(d in DEPOTS)
  MaxCap(d) :=
    sum(p in PRODUCTS, m in MATERIALS)
      TECH(p, m, d) * x(p, m, d) <= MAXTECH(d)
```

Using named sets

- improves the readability of a model
- makes it easier to apply the model to different sized data sets
- makes the model easier to maintain

2.4 Reading data in from text files

Read data into COST from `cost.dat`

```
initializations from 'cost.dat'
  COST
end-initializations
```

Data file `cost.dat` (dense data format)

```
COST : [3.9 0 4.8
        0 7.5 5.5]
```

Data file `cost2.dat` (sparse data format)

```
COST: [("Oil1" 1) 3.9 ("Oil1" 3) 4.8
       ("Oil2" 2) 7.5 ("Oil2" 3) 5.5]
```

Mosel data format:

- file may include single line comments, marked with '!'
- format: label, colon, data value(s)
- for an array, use a single list enclosed in []
- list may be comma or space separated
- dense format: the values fill the data table starting at the first position and varying the last index most rapidly
- sparse format: each data item is preceded by the corresponding index tuple (in brackets)

Specifying the absolute path

```
initializations from 'c:/data/cost.dat'
  COST
end-initializations
```

Path relative to current working directory	<pre>initializations from './cost.dat' COST end-initializations</pre>
Read several data tables from a single file	<pre>initializations from 'cost.dat' SCOST PCOST end-initializations</pre>
Different data label and model object names	<pre>initializations from 'cost.dat' COST as 'COST_DETAILS' end-initializations</pre>
Read several data arrays with identical index sets from a single table	<pre>initializations from 'chess.dat' [DUR,WOOD,PROFIT] as 'ChessData' end-initializations</pre>

2.5 Writing data out to text files

You can write out values in an analogous way to reading them in

```
initializations to 'cost.dat'
COST
end-initializations
```

To write out the solution values of variables, or other solution values (slack, activity, dual, reduced cost) you must first put the values into a data table

```
declarations
  make_sol: array(ITEMS,TIME) of real
  obj_sol: real
end-declarations

forall(i in ITEMS, t in TIME)
  make_sol(i,t) := getsol(make(i,t))

obj_sol := getobjval

initializations to 'make.dat'
  make_sol
  obj_sol
end-initializations
```

Alternatively, you can use `evaluation of` directly in the initializations block

```
initializations to 'make.dat'
  evaluation of
    array(i in ITEMS, t in TIME) getsol(make(i,t)) as 'make_sol'
  evaluation of getobjval as 'obj_sol'
end-initializations
```

2.6 User defined data formats

Mosel also provides functions which allow you to read data in from and write data out to text files using any format (see list in Section 4.6).

Reading in free format data

```
declarations
  ii, jj: integer ! Don't use normal i,j
```

```

end-declarations

fopen('cost.dat', F_INPUT)
while(not iseof)
  readln(ii, ', ', jj, ', ', COST(ii,jj))
fclose(F_INPUT)

fopen('xsol.dat', F_OUTPUT)
forall(s in SUP, d in DEP)
  writeln(s, ', ', d, ', ', getsol(x(s,d)))
fclose(F_OUTPUT)

```

Writing out data in user format

2.7 Using other data sources

The `initializations` block can work with many different data sources and formats thanks to the notion of *I/O drivers*.

I/O drivers for physical data files:

- *mmodbc.odbc* for databases with ODBC connector
- *mmsheet.excel* for MS Excel spreadsheets
- *mmsheet.xls* and *mmsheet.xlsx* for generic spreadsheet access, including on non-Windows platforms
- *mmsheet.csv* for CSV format files
- *mmoci.oci* for Oracle databases
- *mmetc.diskdata* for mp-model style data files

Other drivers are available, e.g. for data exchange in memory between models or between a model and the host application.

Change of the data source = change of the I/O driver, no other modifications to your model

```

initializations from "mmsheet.xls:mydat.xls"
  COST as 'CostData'
end-initializations

initializations to "mmodbc.odbc:mydat.mdb"
  SOL as 'SolTable'
end-initializations

```

3 Model building style recommendations

- Separation of problem logic and data
 - Typically, the model logic stays constant once developed, with the data changing each run
 - Fix the model and obtain data from their source to avoid editing the model which can create errors, expose intellectual property, and is impractical for industrial size data
- You should aim to build a model with sections in this order
 - *constant data*: declare, initialize
 - *all non-constant objects*: declare
 - *variable data*: initialize / input / calculate
 - *decision variables*: create, specify bounds
 - *constraints*: declare, specify

- *objective*: declare, specify, optimize
- Use a **naming convention** that distinguishes between different model object types, for example
 - known values (data) using upper case
 - unknown values (variables) using lower case
 - constraints using mixed case
- Variables are *actions* that your model will prescribe
 - Use verbs for the names of variables. This emphasizes that variables represent '*what to do*' decisions
- Try to include 'min' or 'max' in the name of your objective function; an objective function called 'OBJ' is not very helpful when taken out of context!
- Indices are the *objects* that the actions are performed on
 - Use nouns for the names of indices
- Declare all objects in your model (optional unless using compiler option `noimplicit`)
 - Allows the compiler to detect syntax errors more easily
 - Mosel's guessed declaration doesn't always work
 - A form of rigour and documentation
 - An opportunity for a descriptive comment
- **Comments** are essential for a well written model
 - Always use a comment to explain what each parameter, data table, variable, and constraint is for when you declare it
 - Add extra comments to explain any complex calculation etc
 - Comments in Mosel:

```

declarations
  make: array(1..NP, 1..NT) of mpvar    ! Amount of p produced in time t
  sell: array(1..NP, 1..NT) of mpvar    ! Amount of p sold in time t
end-declarations

(! And here is a multi-line
  comment !) forall(t in 1..NT) ...

```

4 Mosel Language overview

4.1 Structure of a Mosel model

A Mosel model (text file with extension `.mos`) has the form

```

model model_name

  Compiler directives

  Parameters

  Body

end-model

```

- Compiler directives**
- Options are specified as a *compiler directive*, at the beginning of the model
 - Options include `explterm`, which means that each statement must end with a semi-colon, and `noimplicit`, which forces all objects to be declared

```
options explterm
options noimplicit
```
 - `uses` statements are also compiler directives

```
uses "mmxprs", "mmodbc"
```
 - Can define a version number for your model

```
version 1.0.0
```
- Run-time parameters**
- Scalars (of type `integer`, `real`, `boolean`, or `string`) with a specified default value
 - Their value may be reset when executing the model
 - Use `initializations from` for inputting structured data (arrays, sets,...)
 - At most one `parameters` block per model
- Model body**
- Model statements other than compiler directives and parameters, including any number of
 - declarations
 - `initializations from/initializations to`
 - functions and procedures
- Implicit declaration**
- Mosel does *not* require all objects to be declared
 - Simple objects can be used without declaring them, if their type is obvious
 - Use the `noimplicit` option to force all objects to be declared before using them (see item *Compiler directives* above)
- Mosel statements**
- Can extend over several lines and use spaces
 - However, a line break acts as an expression terminator
 - To continue an expression, it must be cut after a symbol that implies continuation (e.g. `+ - , *`)

4.2 Data structures

`array`, `set`, `list`, `record` and any combinations thereof, e.g.,

```
S: set of list of integer
A: array(range) of set of real
```

Arrays *Array*: collection of labeled objects of a given type where the label of an array entry is defined by its index tuple

```
declarations
A: array(1..5) of real
B: array(range, set of string) of integer
```

```

x: array(1..10) of mpvar
C: array(1..5) of real
end-declarations

A:: [4.5, 2.3, 7, 1.5, 10]
A(2):= 1.2
B:: (2..4, ["ABC", "DE", "KLM"]) [15,100,90,60,40,15,10,1,30]
C:= array(i in 1..5) x(i).sol

```

Sets

Set: collection of objects of the same type without establishing an order among them (as opposed to arrays and lists)
Set elements are unique: if the same element is added twice the set still only contains it once.

```

declarations
S: set of string
R: range
end-declarations

S:= {"A", "B", "C", "D"}
R:= 1..10

```

Lists

List: collection of objects of the same type
A list may contain the same element several times. The order of the list elements is specified by construction.

```

declarations
L: list of integer
M: array(range) of list of string
end-declarations

L:= [1,2,3,4,5]
M:: (2..4) [{"A", "B", "C"}, {"D", "E"}, {"F", "G", "H", "I"}]

```

Records

Record: finite collection of objects of any type
Each component of a record is called a *field* and is characterized by its name and its type.

```

declarations
ARC: array(ARCSET:range) of record
    Source, Sink: string      ! Source and sink of arc
    Cost: real                ! Cost coefficient
end-record
end-declarations

ARC(1).Source:= "B"
ARC(3).Cost:= 1.5

```

User types

User types are treated in the same way as the predefined types of the Mosel language. New types are defined in `declarations` blocks by specifying a type name, followed by `=`, and the definition of the type.

```

declarations
myreal = real
myarray = array(1..10) of myreal
COST: myarray
end-declarations

```

4.3 Selection statements

```

if ... end-if           if c=1 then

```

	<pre>writeln('c equals 1') end-if</pre>
if ... else ... end-if	<pre>if c=1 then writeln('c equals 1') else writeln('c does not equal 1') end-if</pre>
if ... elif ... else ... end-if	<pre>if c=1 then writeln('c equals 1') elif c>1 then writeln('c is bigger than 1') else writeln('c is smaller than 1') end-if</pre>
case ... end-case	<pre>case c of 1,2 : writeln('c equals 1 or 2') 3 : writeln('c equals 3') 4..6: do writeln('c is in 4..6') writeln('c is not 1, 2 or 3') end-do else writeln('c is not in 1..6') end-case</pre>

4.4 Loops

forall	<pre>forall(f in FAC, t in TIME) make(f,t) <= MAXCAP(f,t) forall(t in TIME) do use(t) <= MAXUSE(t) buy(t) <= MAXBUY(t) end-do</pre>
with	equivalent to a forall loop stopped after the first iteration <pre>with f='F1', t=1 do make(f,t) <= MAXCAP(f,t) end-do</pre>
while	<pre>i := 1 while (i <= 10) do write(' ', i) i += 1 end-do</pre>
repeat ... until	<pre>i := 1 repeat write(' ', i) i += 1 until (i > 10)</pre>
break, next	<ul style="list-style-type: none"> ■ break jumps out of the current loop ■ break <i>n</i> jumps out of <i>n</i> nested loops (where <i>n</i> is a positive integer) ■ next jumps to the beginning of the next iteration of the current loop ■ use break '<i>looplabel</i>' and next '<i>looplabel</i>' with labeled loops: <pre>'L1': repeat 'L2': while (condition1) do if condition2 then</pre>

```

        break 'L1'
      end-if
    end-do
  until condition3

```

counter

- Use the construct `as counter` to specify a counter variable in a bounded loop (i.e., `forall` or aggregate operators such as `sum`). At each iteration, the counter is incremented

```

cnt:=0.0
writeln("Average of odd numbers in 1..10: ",
        (sum(cnt as counter, i in 1..10 | isodd(i)) i) / cnt)

```

4.5 Operators

Assignment operators

```

i := 10
i += 20      ! Same as i := i + 20
i -= 5       ! Same as i := i - 5

```

Assignment operators with linear constraints

```

C := 5*x + 2*y <= 20
D := C + 7*y

```

then D is

```

D := 5*x + 9*y - 20

```

The constraint type is dropped with `:=`

```

C := 5*x + 2*y <= 20
C += 7*y

```

then C is

```

C := 5*x + 9*y <= 20

```

The constraint type is retained with `+=`, `-=`

Arithmetic operators

standard:	+ - * /
power:	^
int. division/remainder:	mod div
sum:	sum(i in 1..10) ...
product:	prod(i in 1..10) ...
minimum/maximum:	min(i in 1..10) ...
count:	count(i in 1..10 isodd(i))

Linear and non-linear expressions

Decision variables can be combined into linear or non-linear expressions using the arithmetic operators

- module `mmxprs` only works with linear constraints, so no `prod`, `min`, `max`, ...
- other solver modules, e.g., `mmquad`, `mmnl`, `mmxnlp`, also accept (certain) non-linear expressions

Logical operators

constants: true, false
 standard: and, or, not
 AND: and(i in 1..10) ...
 OR: or(i in 1..10) ...
 comparison: <, >, =, <>, <=, >=

Set operators

constants: {'A', 'B'}
 union: +
 union: union(i in 1..10) ...
 intersection: *
 intersection: inter(i in 1..10) ...
 difference: -

Set comparison operators

subset: Set1 <= Set2
 superset: Set1 >= Set2
 equals: Set1 = Set2
 not equals: Set1 <>Set2
 element of: "Oil5" in Set1
 not element of: "Oil5" not in Set1

List operators

constants: [1, 2, 3]
 concatenation: +, sum
 truncation: -
 equals: L1 = L2
 not equals: L1 <>L2

4.6 Built in functions and procedures

The following is a list of built in functions and procedures of the Mosel language (excluding modules). Functions return a value; procedures do not.

Dynamic array handling	create	exists	delcell	isdynamic
Freeze (finalize) a dynamic set	finalize			
Rounding functions	ceil	floor	round	abs
Mathematical functions	exp	log	ln	sqrt
	cos	sin	arctan	
	isodd			
Special real values	isfinite	isinf	isnan	
Random number generator	random	setrandseed		
Minimum/maximum of a list of values	v := minlist(5, 7, 2, 9)	w := maxlist(CAP(1), CAP(2))		
Inline "if" function	MAX_INVEN(t) := if(t < MAX_TIME, 1000, 0)			
	Inven(t) := stock(t) = buy(t) - sell(t) + if(t > 1, stock(t-1), 0)			
Matrix export to file	exportprob			

File handling	fopen	fclose	fselect	
	getfid	getfname	getreadcnt	
	iseof	fflush	fskipline	
	fwrite[_] / fwriteln[_]			
	read / readln	write[_] / writeln[_]		
String handling	strfmt	substr	–	
Access and modify model objects	getcoeff[s]	setcoeff	getvars	
	sethidden	ishidden	setname	setrange
	gettype	settype	getsize	
	makesos1	makesos2		
	getelt	getfirst	getlast	findfirst
	findlast	gethead	gettail	cutelt
	cutfirst	cutlast	cuthead	cuttail
	reverse	getreverse	splithead	splittail
Access solution values	getobjval			
	getsol	getrcost		
	getslack	getact	getdual	
Exit from a model	exit			
Mosel controls	getparam	setparam	localsetparam	restoreparam
Date/time	currentdate	currenttime	timestamp	
Bit value handling	bitflip	bitneg	bitset	
	bitshift	bittest	bitval	
Miscellaneous	asproc	assert	compare	datablock
	memoryuse	newmuid	publish	unpublish
	reset	setioerr	setmatherr	
	versionnum	versionstr		

■ Overloading of subroutines

- Some functions or procedures are *overloaded*: a single subroutine can be called with different types and numbers of arguments

■ Additional subroutines are provided by *Mosel library modules*, which extend the basic Mosel language, e.g.,

- *mmxprs*: Xpress Optimizer
- *mmodbc*: ODBC data connection
- *mmsystem*: system calls; text handling
- *mmjobs*: handling multiple models and (remote) Mosel instances
- *mmsvg*: graphics

⇒ See the ‘Mosel Language Reference Manual’ for full details

■ User-defined functions and procedures

- You can also write your own functions and procedures within a Mosel model
- Structure of subroutines is similar to a `model` (may have `declarations` blocks)
- User subroutines may define overloaded versions of built in subroutines

⇒ See examples in the ‘Mosel User Guide’ (Chapter *Functions and procedures*)

■ Packages

- Additional subroutines may also be provided through *packages* (Mosel libraries written in the Mosel language as opposed to Mosel modules that are implemented in C)

⇒ See the ‘Mosel User Guide’ for further detail (Chapter *Packages*)

4.7 Constraint handling

```

Ctr1:= 2*x + y <= 10      ! Named constraints
Ctr2:= x is_integer

2*x + y <= 10            ! Anonymous constraints
y >= 5

```

Named constraints can be	accessed:	<code>val:= getact(Ctr)</code> <code>getvars(Ctr, vars)</code>
	hidden:	<code>sethidden(Ctr, true)</code>
	redefined:	<code>Ctr:= x+y <= 10</code> <code>Ctr:= 2*x+5*y >= 5</code>
	modified:	<code>Ctr += 2*x</code> <code>settype(Ctr, CT_UNB)</code>
	deleted (reset):	<code>Ctr:= 0</code>

Anonymous constraints are constraints that are specified without assigning them to a `linctr` variable. *Bounds* are (to Mosel) just simple constraints without a name. Anonymous constraints are applied in the optimization problem just like ordinary constraints. The only difference is that it is not possible to refer to them again, either to modify them, or to examine their solution value.

4.8 Problem handling

- Mosel can handle several *problems* in a given *model* file. A default problem is associated with every model.
- Built in type `mpproblem` to identify mathematical programming problems
 - The same decision variable (type `mpvar`) may be used in several problems
 - Constraints (type `linctr`) belong to the problem where they are defined
- The statement `with` allows to open a problem (= select the active problem):

```

declarations
  myprob: mpproblem
end-declarations
...
with myprob do
  x+y >= 0
end-do

```

- Modules can define other specific problem types. New problem types can also be defined by combining existing ones, for instance:

```
mypbtyp = mpproblem and somepbtype
```

- Problem types support assignment: `P1 := P2`
and additive assignment: `P1 += P2`

4.9 Reserved words

The following words are reserved in Mosel. The upper case versions are also reserved (*i.e.* AND and and are keywords but not And). Do not use them in a model except with their built-in meaning.

```

a:  and array as
b:  boolean break
c:  case constant count counter
d:  declarations div do dynamic
e:  elif else end evaluation
f:  false forall forward from function
h:  hashmap
i:  if imports in include initialisations initializations
    integer inter is_binary is_continuous is_free is_integer
    is_partint is_semcont is_semint is_sos1 is_sos2
l:  linctr list
m:  max min mod model mpvar
n:  namespace next not nsgroup nssearch
o:  of options or
p:  package parameters procedure public prod
r:  range real record repeat requirements return
s:  set shared string sum
t:  then to true
u:  union until uses
v:  version
w:  while with

```

4.10 Annotations

- *Annotations* are meta data in a Mosel source file that are stored in the resulting BIM file after compilation; no impact on the model itself (treated like comments); either global or associated with public globally declared objects (including subroutines).
- Single-line annotations start with '!@' and a name; blocks are surrounded by '!@' and '!)
- !@doc.descr denotes the annotation marker descr within category doc (predefined category names are mc and doc, user-defined names can also be employed)

```

(!@doc.  Enter category 'doc' (this text is ignored)
 @ descr This is the value of 'doc.descr'
 @.      Jump back to root (this text is ignored)
 @mynote Contents of 'mynote' (full name: '.mynote')
 @.anote Complete form of an annotation in default category
 !)
```

- *Declaring annotations* (via the mc.def compiler annotation): optional; enables the compiler to check the validity of the definitions and reject non-compliant ones

```

! Defining an alias that redirects onto 2 different annotations:
!@mc.def descr alias doc.descr om.descr
```

- *mosel doc* tool: generates an XML model documentation that is processed into HTML pages

1. Compile source model file with option -D

```
mosel comp -D mymodel.mos
```

2. Run program mosel doc

```

mosel doc mymodel           Generates HTML and XML
mosel doc -o mydir -html mymodel  HTML only, specifying output directory
mosel doc -f -xml mymodel       XML only, forcing output overwrite
```

See 'Mosel Language Reference', section *Documenting models using annotations* for a list of the doc annotations

5 Using the Mosel Command Line

The Mosel Command Line is supported on all platforms that Mosel can be run on.

Standard sequence for model execution from the command line:

```
mosel exec mymodel.mos      Execute (=compile/load/run) model 'mymodel.mos'
mosel mymodel               Short form (works with 'mymodel.mos' or 'mymodel.bim')
```

Some useful commands (see 'Mosel Language Reference manual' for the full list):

<i>Command line help text:</i>	<code>mosel -h</code>
<i>Mosel version:</i>	<code>mosel -V</code>
<i>Display functionality:</i>	<code>mosel exam[ine] [-cspthirvaum]</code>
<i>Execute a model file:</i>	<code>mosel exec[ute]</code>
<i>Compile a model file:</i>	<code>mosel comp[ile] mymodel.mos</code>
<i>Load and run a BIM file:</i>	<code>mosel run mymodel.bim</code>
<i>Start the debugger:</i>	<code>mosel debug mymodel.mos</code>
<i>Run the profiler:</i>	<code>mosel prof[ile] mymodel.mos</code>
<i>Perform a code coverage run:</i>	<code>mosel cover[age] mymodel.mos</code>
<i>List available modules/packages:</i>	<code>mosel lslib</code>

Examples:

```
mosel comp mymodel.mos -o mybim.bim  Compile to a specified BIM file name/location
mosel prof mymodel.mos               Perform a profiler run (output in 'mymodel.mos.prof')
mosel exam -h                        Display Mosel version info and paths
mosel exam -a mybim.bim              Display annotations of a model or package
mosel exam -ps mmxprs                Display parameters and subroutines of module 'mmxprs'
```

Setting model runtime parameters:

```
mosel exec mymodel NT=5 DATAFILE="mynewdata.dat"  Source in mymodel.mos
mosel run mymodel NT=5 DATAFILE="mynewdata.dat"  Loads mymodel.bim
mosel mymodel NT=5 DATAFILE="mynewdata.dat"      With mymodel.mos or mymodel.bim
```

5.1 Debugger commands

<i>Breakpoints:</i>	<code>break delete bcond[ition] breakpoints breaksub</code>
<i>Model execution:</i>	<code>cont next step finish model</code>
<i>Output:</i>	<code>display undisplay list print info exportprob lsattr lslibs lslocal lsmods lssymb</code>
<i>Stack access:</i>	<code>up down where</code>
<i>Interpreter options:</i>	<code>option</code>
<i>Termination:</i>	<code>quit</code>

Example: Simple debugging sequence

<pre>mosel debug debugexpl.mos break 20 cont print D cont info Arr lsmods quit</pre>	<pre>Start Mosel debugger Set breakpoint at line 20 Execute up to the breakpoint Print out symbol 'D' Continue model execution Information about model object 'Arr' (e.g. size) Display model info (e.g. memory usage) Quit the debugger</pre>
--	--

Example: Debugging a submodel

<pre>mosel debug debugmaster.mos breaksub 1 cont break 25 debugsub.mos display SNumbers cont break 31 debugsub.mos bcond 2-2 SNumbers.size < 10 cont quit</pre>	<pre>Start Mosel debugger Stop at start of submodels Execute up to the breakpoint Set breakpoint in the submodel Display watch on object 'SNumbers' Execute up to the breakpoint Another submodel breakpoint Condition on 2nd submodel breakpoint Execute up to the breakpoint 2-2 Quit the debugger</pre>
--	--

6 Working with Xpress Workbench

Xpress Workbench is a graphical development environment for Mosel models and Xpress Insight applications.

Workbench panes Model editor (central window), project directory navigation and command history (left), model output and execution log information (bottom), debugging, deployment and collaboration information (right).

Workspace preferences (settings).

Toggle full-screen view for logging pane.

Use menu *Window* >> *Presets* >> *Full IDE* to restore original window layout.

Editor

Code folding and breakpoint markers appear in the grey area immediately left to the text.

Open a new file/tab

Subdivide and re-arrange panes in the editor window

Code folding for blocks of Mosel statements

Unfold folded code

Line position markers during debugging

Model execution

The name of the model is selected in the box next to these buttons, it may be different from the model(s) opened in the editor.

Compile a model.

Execute (compile/load/run) a model.

Execute a model in debug mode.

Open *Compiler Options* or *Run Dialog* windows.

Alternatively, use menu *Run* to compile or run a model.

Debugger

Breakpoints are set by clicking onto the gray area (left to the line number if it is displayed) preceding each row in the editor window, breakpoint conditions can be added via the right mouse button menu on the breakpoint icon.

-  Delete breakpoint/deactivated breakpoint.
-  Delete a conditional/deactivated conditional breakpoint.

Navigating in the debugger:

-  Activate/deactivate all breakpoints.
-  Start/stop the debugger.
-  Resume/suspend model execution.
-  Step over an expression.
-  Step into an expression.
-  Step out of an expression.
-  Don't pause on exceptions.

Deployment to Xpress Insight

-  Publish selected model to Insight.
-  Build an Insight app archive.
-  Debug a scenario.
-  Edit Tableau workbooks.
-  Refresh Insight scenario tree.
